

SN75374 QUADRUPLE MOSFET DRIVER

SLRS028A – SEPTEMBER 1988 – REVISED NOVEMBER 2004

- Quadruple Circuits Capable of Driving High-Capacitance Loads at High Speeds
- Output Supply Voltage Range From 5 V to 24 V
- Low Standby Power Dissipation
- V_{CC3} Supply Maximizes Output Source Voltage

description/ordering information

The SN75374 is a quadruple NAND interface circuit designed to drive power MOSFETs from TTL inputs. It provides the high current and voltage necessary to drive large capacitive loads at high speeds.

The outputs can be switched very close to the V_{CC2} supply rail when V_{CC3} is about 3 V higher than V_{CC2} . V_{CC3} also can be tied directly to V_{CC2} when the source voltage requirements are lower.

SLRS028A – SEPTEMBER 1988 – REVISED NOVEMBER 2004

The diagram shows a 3-state buffer circuit. It has three inputs: **Input A**, **Enable E1**, and **Enable E2**. It has two power supply inputs: **V_{CC1}** and **V_{CC3}**, and a common ground **GND**. The output is **Output Y**. The circuit uses a combination of NMOS and PMOS transistors, along with diodes and resistors, to implement the logic. The output **Y** is connected to **V_{CC2}** and **GND**. The circuit is designed to be compatible with both CMOS and TTL logic families.

Supply voltage range (see Note 1):	V_{CC1}		-0.5 V to 7 V
	V_{CC2}		-0.5 V to 25 V
	V_{CC3}		-0.5 V to 30 V
Input voltage, V_I			5.5 V
Peak output current, I_L ($t_W < 10$ ms, duty cycle $< 50\%$)			500 mA
Package thermal impedance, θ_{JA} (see Notes 2 and 3):	D package		73°C/W
	N package		67°C/W
Operating virtual junction temperature, T_J			150°C
Storage temperature range, T_{Stg}			-65°C to 150°C

NOTES: 1. Voltage values are with respect to network ground terminal.

- Maximum power dissipation is a function of $T_J(\text{max})$, θ_{JA} , and T_A . The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_J(\text{max}) - T_A)/\theta_{JA}$. Operating at the absolute maximum T_J of 150°C can affect reliability.

		MIN	NOM	MAX	UNIT

SN75374

QUADRUPLE MOSFET DRIVER

SLRS028A – SEPTEMBER 1988 – REVISED NOVEMBER 2004

THERMAL INFORMATION

power-dissipation precautions

Significant power may be dissipated in the SN75374 driver when charging and discharging high-capacitance loads over a wide voltage range at high frequencies. Figure 12 shows the power dissipated in a typical SN75374 as a function of frequency and load capacitance. Average power dissipated by this driver is derived from the equation:

$$P_{T(AV)} = P_{DC(AV)} + P_{C(AV)} + P_{S(AV)}$$

where $P_{DC(AV)}$ is the steady-state power dissipation with the output high or low, $P_{C(AV)}$ is the power level during charging or discharging of the load capacitance, and $P_{S(AV)}$ is the power dissipation during switching between the low and high levels. None of these include energy transferred to the load, and all are averaged over a full cycle.

The power components per driver channel are:

$$P_{DC(AV)} = \frac{(P_H t_H + P_L t_L)}{T}$$

$$P_{C(AV)} \approx CV^2 f$$

$$P_{S(AV)} = \frac{(P_{LH} t_{LH} + P_{HL} t_{HL})}{T}$$

where the times are as defined in Figure 15.

Figure 13. Output-Voltage Waveform

THERMAL INFORMATION

power-dissipation precautions (continued)

P_L , P_H , P_{LH} , and P_{HL} are the respective instantaneous levels of power dissipation, and C is the load capacitance. V_C is the voltage across the load capacitance during the charge cycle shown by the equation:

$$V_C = V_{OH} - V_{OL}$$

$P_{S(AV)}$ may be ignored for power calculations at low frequencies.

In the following power calculation, all four channels are operating under identical conditions: $f = 0.2$ MHz, $V_{OH} = 19.9$ V and $V_{OL} = 0.15$ V with $V_{CC1} = 5$ V, $V_{CC2} = 20$ V, $V_{CC3} = 24$ V, $V_C = 19.75$ V, $C = 1000$ pF, and the duty cycle = 60%. At 0.2 MHz for $C_L < 2000$ pF, $P_{S(AV)}$ is negligible and can be ignored. When the output voltage is low, I_{CC2} is negligible and can be ignored.

On a per-channel basis using data-sheet values,

$$P_{DC(AV)} = \left[5 \text{ V} \left(\frac{4 \text{ mA}}{4} \right) + 20 \text{ V} \left(\frac{-2.2 \text{ mA}}{4} \right) + 24 \text{ V} \left(\frac{2.2 \text{ mA}}{4} \right) \right] 0.6 +$$

$$\left[5 \text{ V} \left(\frac{31 \text{ mA}}{4} \right) + 20 \text{ V} \left(\frac{0 \text{ mA}}{4} \right) + 24 \text{ V} \left(\frac{16 \text{ mA}}{4} \right) \right] 0.4$$

$$P_{DC(AV)} = 58.2 \text{ mW per channel}$$

Power during the charging time of the load capacitance is

$$P_{C(AV)} = (1000 \text{ pF})(19.75 \text{ V})^2(0.2 \text{ MHz}) = 78 \text{ mW per channel}$$

Total power for each driver is:

$$P_{T(AV)} = 58.2 \text{ mW} + 78 \text{ mW} = 136.2 \text{ mW}$$

The total package power is:

$$P_{T(AV)} = (136.2)(4) = 544.8 \text{ mW}$$

APPLICATION INFORMATION

driving power MOSFETs

The drive requirements of power MOSFETs are much lower than comparable bipolar power transistors. The input impedance of an FET consists of a reverse-biased PN junction that can be described as a large capacitance in parallel with a very high resistance. For this reason, the commonly used open-collector driver with a pullup resistor is not satisfactory for high-speed applications. In Figure 14a, an IRF151 power MOSFET switching an inductive load is driven by an open-collector transistor driver with a 470- Ω pullup resistor. The input capacitance (C_{ISS}) specification for an IRF151 is 4000 pF maximum. The resulting long turn-on time, due to the product of input capacitance and the pullup resistor, is shown in Figure 14b.

Figure 14. Power MOSFET Drive Using SN75447

A faster, more efficient drive circuit uses an active pullup, as well as an active pulldown output configuration, referred to as a totem-pole output. The SN75374 driver provides the high-speed totem-pole drive desired in an application of this type (see Figure 15a). The resulting faster switching speeds are shown in Figure 15b.

Figure 15. Power MOSFET Drive Using SN75374

APPLICATION INFORMATION

driving power MOSFETs (continued)

Power MOSFET drivers must be capable of supplying high peak currents to achieve fast switching speeds as shown by the equation:

$$I_{PK} = \frac{VC}{t_r}$$

where C is the capacitive load and t_r is the desired rise time. V is the voltage that the capacitance is charged to. In the circuit shown in Figure 14a, V is found by the equation:

$$V = V_{OH} - V_{OL}$$

Peak current required to maintain a rise time of 100 ns in the circuit of Figure 14a is:

$$I_{PK} = \frac{(3 - 0)4(10^{-9})}{100(10^{-9})} = 120 \text{ mA}$$

Circuit capacitance can be ignored because it is very small compared to the input capacitance of the IRF151. With a V_{CC} of 5 V and assuming worst-case conditions, the gate drive voltage is 3 V.

For applications in which the full voltage of V_{CC2} must be supplied to the MOSFET gate, V_{CC3} should be at least 3 V higher than V_{CC2} .

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
